COVID-19 Virus in Wastewater Samples

The blue line graph shows the amount of the virus detected in the wastewater sample by the date the sample was collected.

Reported COVID-19 Cases by Onset Date*

It is important to know, each system varies in wastewater flows and other factors, so it is not practical to compare wastewater samples from one system to another. Additionally, wastewater surveillance data cannot tell us how many people are currently infected with COVID-19. However, when used in combination with other public health information, it can alert us to meaningful increasing or decreasing trends.
